

SUPREME COURT OF OREGON

McClaghry v. Sandwell International, Inc.

273 Or. 481 (1975) · Decided November 6, 1975

SUMMARY

An employee of American Can Company sued Sandwell International, the designer of the company’s paper plant, for injuries caused when a bridged pile of chips collapsed over an underground plate feeder. The Oregon Supreme Court affirmed the judgment for the plaintiff, holding that the evidence supported findings that Sandwell could have foreseen the danger and should have provided warnings or a means to locate the feeder, and that contributory negligence was properly submitted to the jury.

CASE DETAILS

COURT	Supreme Court of Oregon
WRITING FOR THE COURT	O’Connell, C. J.; Bryson; Connell; Denecke; Howell; Tongue
JURISDICTION	Oregon
DECIDED	November 6, 1975
DISPOSITION	affirmed
PROCEDURAL POSTURE	Employee brought a negligence action against the designer of an industrial paper plant for personal injuries allegedly caused by a defect in the plant's design. A jury returned a verdict for the employee, and the defendant appealed from the resulting judgment.
STANDARD OF REVIEW	The court reviewed whether the evidence was sufficient to submit negligence and contributory negligence issues to the jury and whether any redundancy in the negligence specifications prejudiced the defendant.
PRECEDENTIAL VALUE	Published Oregon Supreme Court opinion
PARTIES	Sandwell International, Inc. v. McClaghry

TOPICS

- negligence
- standard of care
- duty of care
- contributory negligence
- personal injury

PRACTICE AREAS

- torts
- negligence
- personal injury
- products liability

QUESTIONS PRESENTED

1. Whether the evidence permitted the jury to find that Sandwell negligently failed to design or provide a warning or locating device for the plate feeder.
2. Whether the evidence permitted the jury to find that Sandwell could reasonably foresee that the facility would be operated with chip piles exceeding the fifteen-foot design limitation.
3. Whether McClaughry's contributory negligence was established as a matter of law or was properly submitted to the jury.
4. Whether the trial court erred by refusing to strike the second specification of negligence as unsupported and redundant.

HOLDINGS

1. The evidence permitted the jury to find that a reasonable designer should have anticipated that increased chip volumes could lead to piles exceeding fifteen feet and should have provided a warning or locating device to reduce the resulting risk of injury.
2. Contributory negligence was properly submitted to the jury because the evidence permitted a finding that McClaughry acted reasonably and could not have avoided the accident through the exercise of reasonable care.
3. Even assuming that the two negligence specifications were redundant, the redundancy did not warrant striking the specification because the defendant failed to show prejudice.

KEY QUOTATIONS

“Even if the jury believed that defendant had notified American Can Company that, the operations were intended to be limited as described, the jury might still find that a reasonable designer should have anticipated the situation in which an increased volume of chips would be brought into the storage area and that large volumes of chips would be piled above the plate feeder, thus creating an unreasonable risk of harm to American Can Company employees.” (485)

“The issue of contributory negligence was properly submitted to the jury.” (485-486)

FACTUAL BACKGROUND

Sandwell designed a chip- and sawdust-handling facility for an American Can Company paper plant in Oregon. The facility used a plate feeder beneath a pile of chips; when the pile exceeded approximately fifteen feet, bridging could create a concealed hollow core. McClaughry, operating a tractor, drove onto a pile approximately forty feet high that had bridged, causing the pile to collapse and injuring him. The design included no written operating instructions or warning or locating device for the plate feeder, although evidence showed such a device was feasible at reasonable cost.

PROCEDURAL HISTORY

The trial court entered judgment on a jury verdict for McClaughry. Sandwell appealed, arguing that the evidence did not establish negligence, that McClaughry was contributorily negligent, and that one specification of

negligence should have been stricken as unsupported and redundant. The Oregon Supreme Court affirmed.

DISPOSITION

affirmed

OPINION

CONNELL, J.

O'CONNELL, C. J. This is an action brought by an employee of American Can Company against Sandwell International, Inc., the designer of American Can Company's paper plant, to recover damages for personal injuries suffered as a result of an alleged defect in the design of the plant. Defendant appeals from a judgment entered on a verdict for plaintiff. *483 Defendant designed a paper plant, including chip and sawdust handling facility, for American Can Company at Halsey, Oregon.

The plant was designed to receive chips and sawdust at a storage area from which the materials were pushed by a mobile machine to a place on the ground below which a "plate feeder", consisting of a 12-foot rotating device, pulled the chips into an underground conveyor system. When operating perfectly, the plate feeder removed the chips in such a way that an expanding dimple or depression would form in the pile as the chips were removed.

However, when too many chips were piled above the feeder occasionally a "bridging" effect occurs, causing a hollow core to form underneath the pile. In these circumstances the outer part of the pile appears to be a solid mound. Bridging would not occur if the pile did not exceed 15 feet in height. Plaintiff was the operator of a tractor with blade which was used to push the chips into a pile above the plate feeder.

Plaintiff was injured when he drove his tractor onto a pile of chips about forty feet in height which had bridged underneath. The weight of the tractor caused the pile to collapse into the air space left by the bridging effect. Plaintiff was injured when this occurred. Plaintiff's complaint alleged that defendant was negligent in that "(a) The defendant neglected and failed to provide a warning device as to the location of the plate feeder for employees operating equipment in the immediate vicinity thereof. "(b) The defendant failed to provide any means of ascertaining the location of the plate feeder while equipment was being operated in the vicinity thereof." Defendant contends that it was not negligent, *484 if it was, plaintiff was contributorily negligent.

It is defendant's position that it designed storage area and chip handling facilities so that piles of not more than 15 feet would be moved to the area above the plate feeder, in which case no bridging would occur and no warning of danger would be necessary.

The evidence was conflicting as to whether this limitation on the height of the pile over the plate was made known to American Can Company. It is admitted by defendant that no written operating instructions were made. There was evidence that the increase in the volume of chips and sawdust brought to the storage area led to the practice of increasing the height of the pile over the feeder plate.

It is undisputed that defendant knew of the danger that would exist if the pile exceeded 15 feet. Plaintiff introduced evidence to show that it would be feasible at a reasonable cost to install a device which would indicate the location of the plate feeder or which would give warning to the equipment operator that he was in the immediate vicinity of the plate feeder.

There was evidence that at the Georgia-Pacific paper plant in Toledo, Oregon a light system had been installed which was designed to reduce the type of accident which occurred in the present case. Plaintiff called as an expert witness a consulting engineer, who testified that the inclusion of a system to give warning to the operator of equipment as to the location of the plate feeder would be essential to an adequate design.

Defendant's defense rests upon the premise that its design called for the operation of the chip handling facilities in such a way that, if followed, there would be no bridging and therefore no chance of injury resulting from it.

However, as we have pointed out above, there was evidence which would permit the jury *485 to believe that the limited manner of operation to which defendant intended the design to be confined was not made known to American Can Company, and the jury could, therefore, find that defendant could have foreseen that a change in operation might occur which would endanger an equipment operator.

Even if the jury believed that defendant had notified American Can Company that the operations were intended to be limited as described, the jury might still find that a reasonable designer should have anticipated the situation in which an increased volume of chips would be brought into the storage area and that large volumes of chips would be piled above the plate feeder, thus creating an unreasonable risk of harm to American Can Company employees.

The issue of contributory negligence was properly submitted to the jury. There was evidence to establish that even with the exercise of reasonable care, plaintiff could not have avoided the accident which caused his injuries.

The jury could reasonably have found that because plaintiff took over from another shift which had already moved chips into a position making it difficult or impossible for plaintiff to locate the plate feeder, he acted reasonably in driving the tractor as he did.

The plate feeder had not been run during plaintiff's regular shift (from 7:00 a.m. to 3:00 p.m.). Plaintiff had no knowledge as to whether it had been run during the preceding shift. When plaintiff finished his regular shift and was about to start a four-hour overtime assignment, he received a call informing him that the plant was about to go on chips and he was directed to start moving chips over the plate feeder.

It was during this operation that plaintiff suffered his injuries. The jury could have concluded that plaintiff might reasonably have assumed that there was no indentation in the top of the pile over the plate feeder simply because the plant *486 had not been using chips and therefore no chips had been withdrawn from the bottom of the pile.

Finally, defendant assigns as error the trial court's refusal to strike the second specification of negligence (recited in subparagraph (b) above) on the ground that there was no evidence to support it and for the further reason that it was redundant. Assuming, as defendant contends, that the allegations in subparagraphs (a) and (b) are redundant, we are unable to see what prejudice defendant would suffer from two ways of saying the same thing.

Judgment affirmed.
